

smallest 1. Start 2. Read num1 3. Read num2 4. If num1 < num2 then a. Output num1 Else b. Output num2 5. Stop 5. Write an algorithm to read three numbers then display the largest. 1. Start 2. Read num1 3. Read num2 4. Read num3 5. Set largest = num1 6. If num2 > largest then a. Set largest = num2 7. If num3 > largest then a. Set largest = num3 8. Output largest 9. Stop 6. Write an algorithm to read 100 numbers then display the largest. 1. Start 2. Read the first number 3. Set largest = first number 4. Set counter = 2 5. Repeat while counter ≤ 100 a. Read number b. If number > largest then i. Set largest = number c. Increment counter by 1 6. Output largest 7. Stop

1. Design an algorithm and the corresponding flowchart for finding the sum of the numbers 2, 4, 6, 8, ..., n (output: Algorithm and Flowchart) start input first value input second value if first value > than second value then output first value else output second value stop 2. Write an algorithm to read 100 numbers and then display the sum. - start sum = 0 repeat 100 times: input a number add number to sum output the sum stop 3. Write an algorithm to read two numbers then display the largest. - start input first value input second value if first value > than second value then output first value else output second value stop 4. Write an algorithm to read two numbers then display the smallest - start input first value input second value if first value < than second value then output first value else output second value stop 5. Write an algorithm to read three numbers then display the largest. - start input first value input second value input third value if first value > than second value > third value then output first value if second value > first value > third value Then output second value else output third value stop 6. Write an algorithm to read 100 numbers then display the largest. - start sum = 0 input a number repeat 100 times: output largest number stop
