

SEATWORK. <5.1>	
<MY FIRST FUNCTION>	
Course Code: CPE007	Program: Computer Engineering
Course Title: Programming logic and design	Date Performed: 10/16/2025
Section: CPE11S1	Date Submitted:10/16/2025
Name(s): Hanz Rhayven M. Pabalan	Instructor: Engr. Jimlord Quejado

6. Output

```
#include <iostream>
using namespace std;

void greetUser();
//perimeter computation
int perimComp (int length, int width);

} int main () {
    greetUser();

    int length, width, result;

    cout<< "Enter Length: ";
    cin>>length;

    cout<< "Enter Width: ";
    cin>>width;
    result = perimComp (length, width);

    cout<<"The Perimeter is: ";
    cout<<result<<endl;
- }
} void greetUser() {
    cout<<"Hello Welcome to Perimeter computation ! "<<endl;
- }
- }
} int perimComp (int length, int width) {
    int perimeter = 2 * (length * width);
    return perimeter;
- }
```

```
C:\Users\hanz\OneDrive\Docu
Hello Welcome to Perimeter computation !
Enter Length: 33
Enter Width: 45
The Perimeter is: 2970

-----
Process exited after 8.869 seconds with return value 0
Press any key to continue . . . |
```

Short Analysis:

First we create a void so that our header can minimize the area in our main function, then we initiate our perimeter using int then we put the data which is the length, width.

Next, we create a main then we put the greetUser to call our void, then we create an int to make our cin work, then in the cout we just create a put the, enter the length and cin for user can type the length, and the next cout is the same. Then the result we don't need cin because it will automatically print the output or the multiplied of out length and width. Next, we print our header which is the void in the line 4, then we call our perimeter again then the next int will multiply the length and width, then we return to our perimeter.
